Transformations too big to ignore

Anna-Maria Arabia

Chief Executive

The Australian Academy of Science

June 2025

The Australian Academy of Science

Actuaries
Institute.

The home of science

We bring evidence to decision making

THE ACADEMY WAY

- Independent
- Evidence-based
- Non-partisan
- Reliable
- Respectful of knowledge sources

Convene scientific experts

Shape the science system

Translate the vast knowledge of our Fellowship and the research community so it is fit for purpose for:

- Parliaments
- Classrooms
- Board rooms
- Newsrooms
- Public square

Actuaries
Institute.

Australian Academy of Science

"Science without policy is science. Policy without science is gambling."

Science

- Generates knowledge for public good
 - Deepens understanding of natural world and ourselves
 - Fosters solutions for economic growth, productivity, national security, health, quality of life, democratic institutions, and environment
 - Creates jobs
 - Drives innovation and progress
 - Source of soft (hard?) power and diplomacy
-
- **A national strategic capability, right?**

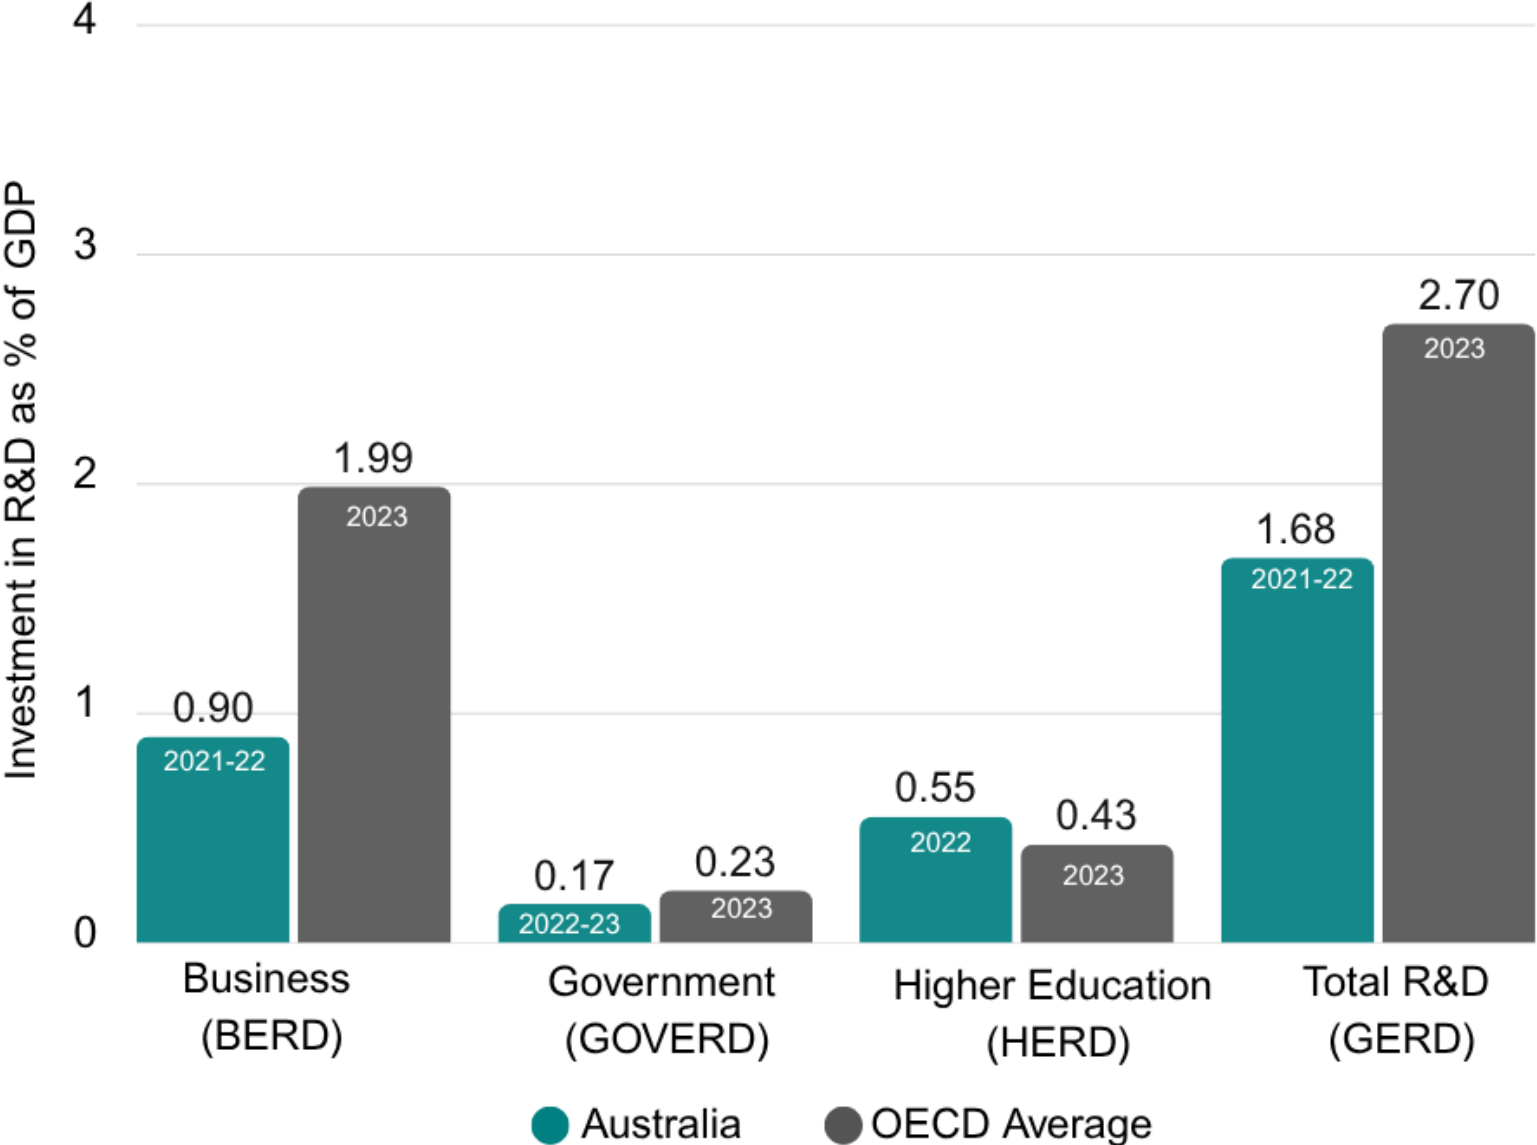

Over the last decade, the percentage of Australia's GDP spent on R&D has fallen

Australia's investment compared to the OECD average.

Source: OECD Main Science and Technology Indicators; Australian Bureau of Statistics

Australia's research intensity compared to other countries (2021-22)

- Australia's R&D intensity has fallen.
- Australia's services and resource-focused economy is one of the least differentiated in the world (93rd).
- Australia's productivity growth has slowed since the mid-2010s
- Australia's public investment has shifted steadily toward near-term translation and commercialisation, eroding the foundational research base that fuels long-term impact.
- Weakens the pipeline of discovery and opportunity to innovate

Business expenditure on research and development (BERD)

\$20.6
Billion
(2021-2022)

0.9% GDP
2021-22
(OECD average at
1.99% GDP)

> 50% BERD in
Australia from
SMEs

Large business
BERD is in decline
(From 68% to 45%
2010-2021)

Business Expenditure on R&D in Australia

Yet, our national ambitions rely on R&D

The Priority Areas Declaration outlines the 7 key sectors as shown below:

Renewables and low emission technologies

Products related to renewable energy, decarbonisation, energy efficiency and waste reduction, recovery and recycling.

Enabling capabilities

Products and technologies that support the advancement of Australia's industrial capability.

Defence capability

Products that are wholly or primarily for use in or in connection with defence.

Transport

Vehicles and parts for aircraft, road vehicles, rail vehicles and ships. Products and components used in infrastructure.

Value-add in resources

Activities and capabilities that generate products with more value from Australia's mining industry and resource base.

Value-add in agriculture, forestry and fisheries

Activities and capabilities that generate products with more value from Australia's primary industries.

Medical science

Products for therapeutic use.

ABOUT

RESEARCH

WORK WITH US

CAREERS

Challenges

There are six challenges we are assisting the nation to overcome, and turn to Australia's unique advantage:

- **Health and wellbeing:** Enhance the health of Australians through preventative, personalised, biomedical and digital health services.
- **Food Security and quality:** Achieve sustainable security through new AgriFood products, technology and innovation for Australia.
- **Secure Australia and region:** Help safeguard Australia from threats (terrorism, regional instability, pandemics, biosecurity, disasters, and cyber- attacks).
- **Resilient and valuable environments:** Enhancing the resilience, sustainable use, and value of our natural and built environments, including by mitigating and adapting to the impacts of climate and global change.
- **Sustainable energy and resources:** Build competitiveness, sustainability and security, nationally and regionally, of our energy and minerals systems and resources while lowering emissions to Net Zero.
- **Future Industries:** Help create Australia's future industries and jobs by collaborating to boost innovation performance and promote Science, Technology, Engineering and Maths (STEM) skills.

The future working population in science

$$P_{i,x+1,t+1} = P_{i,x,t} - D_{i,x,t} - R_{i,x,t} + N_{i,x,t} + G_{i,x,t}, \quad x = 15, 16, \dots$$

The diagram illustrates the components of the population equation. Arrows point from the terms in the equation to their corresponding descriptions:

- $P_{i,x,t}$ points to "Workers aged x at start of year t"
- $D_{i,x,t}$ points to "Deaths"
- $R_{i,x,t}$ points to "Retirements"
- $N_{i,x,t}$ points to "Graduates"
- $G_{i,x,t}$ points to "Migration"

Future population forecasts

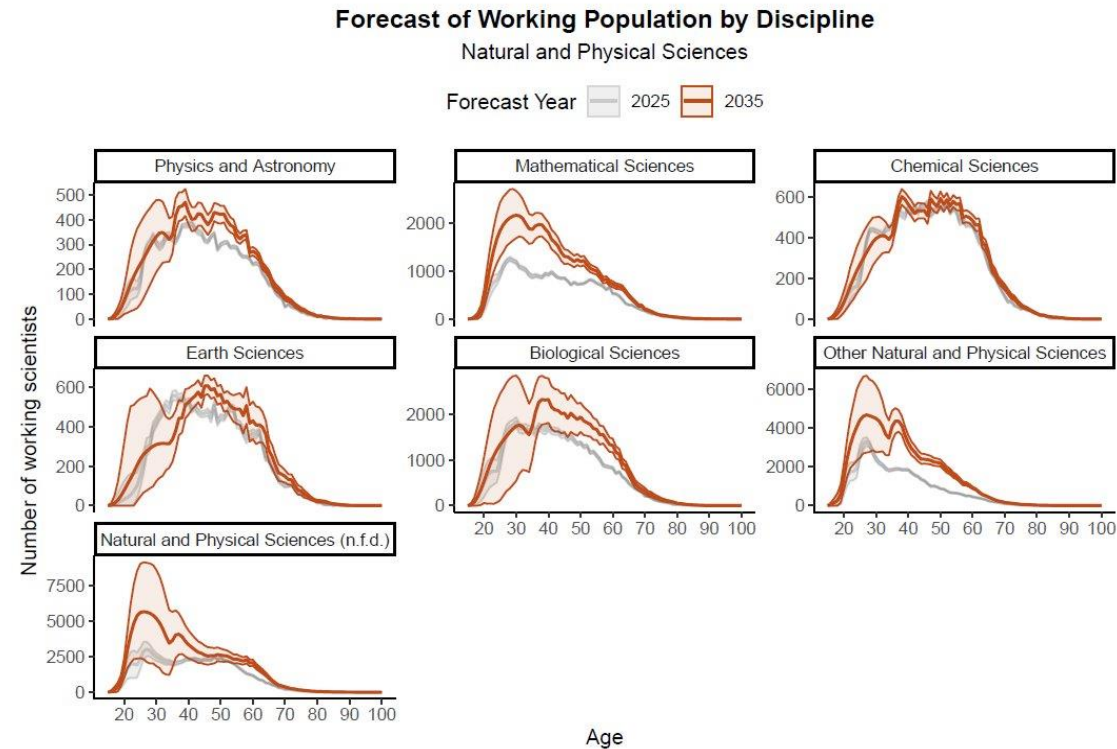

Figure 23: Projected age distribution of the working population in 2025 and 2035 across scientific disciplines. The shaded regions represent the 90% prediction intervals, and the solid lines indicate the mean estimates for each year.

Demand for science capability

DATA SCIENCE

Data science capability is essential to almost all areas of science given the increasingly data-intensive nature of research. Data science capability will help us maximise use of technologies such as high-performance computing, artificial intelligence and remote sensing. Data science also helps businesses understand and use their data for innovation.

STATISTICAL ANALYSIS

Statistical analysis is a foundational capability that enables us to make sense of data, find patterns and make decisions. Statistical analysis helps answer questions about Australia's changing population, understand climate risks, develop algorithms for machine learning and identify trends in health data.

MODELLING

Modelling capability is essential to a range of scientific fields to understand, predict and explore complex systems. Developing and understanding local and global models helps us understand and make decisions in areas such as climate change and extreme weather, public health, biosecurity and quantum computing.

AI in Science

Artificial Intelligence (AI) is shaping the practice of science and transforming industries. Over the next decade, Australia will need expertise in artificial intelligence to enable the responsible development and adoption of AI tools.

CLIMATE SCIENCE

Climate science provides the fundamental knowledge that Australia needs to understand climate risks to our economy, businesses and environment. Knowledge from climate science informs predictions and projections that enable us to anticipate and respond to the impacts of climate change.

AGRICULTURAL SCIENCE

Agricultural science will support precision agriculture, agriculture sector adaptation to climate change and innovation to reduce greenhouse gas emissions. This capability will contribute to food security and biosecurity as our population and environment changes.

BIOTECHNOLOGY

Biotechnology uses biological processes to develop new technologies and solve problems in medicine, agriculture, industry and the environment. Biotechnology capability is in demand for applications such as personalised medicine, rapid drug development, enhanced crops and the development of more sustainable materials and chemicals.

GEOSCIENCE

Geoscience capability underpins various aspects of Australia's economy, society and environment. It is essential to map our natural resources, such as critical minerals, which are necessary for decarbonisation and energy transition. Geoscience also helps us explore options for carbon capture and storage, manage groundwater systems to support water security and predict and mitigate the impacts of natural hazards.

EPIDEMIOLOGY

Epidemiology helps us understand and respond to health threats in an uncertain world. It enables early detection of disease outbreaks, monitoring of the spread of diseases and understanding of who is at risk. As our population grows and changes, capability in epidemiology will support health system planning and inform public health policy.

MATERIALS SCIENCE

Materials science develops the new materials that underpin new technologies. Materials science contributes to innovation, sustainability and economic opportunities through development of semiconductors, superconductors, sustainable energy technologies and circular economy solutions.

All underpinned by fundamental mathematical sciences

Artificial intelligence

The good

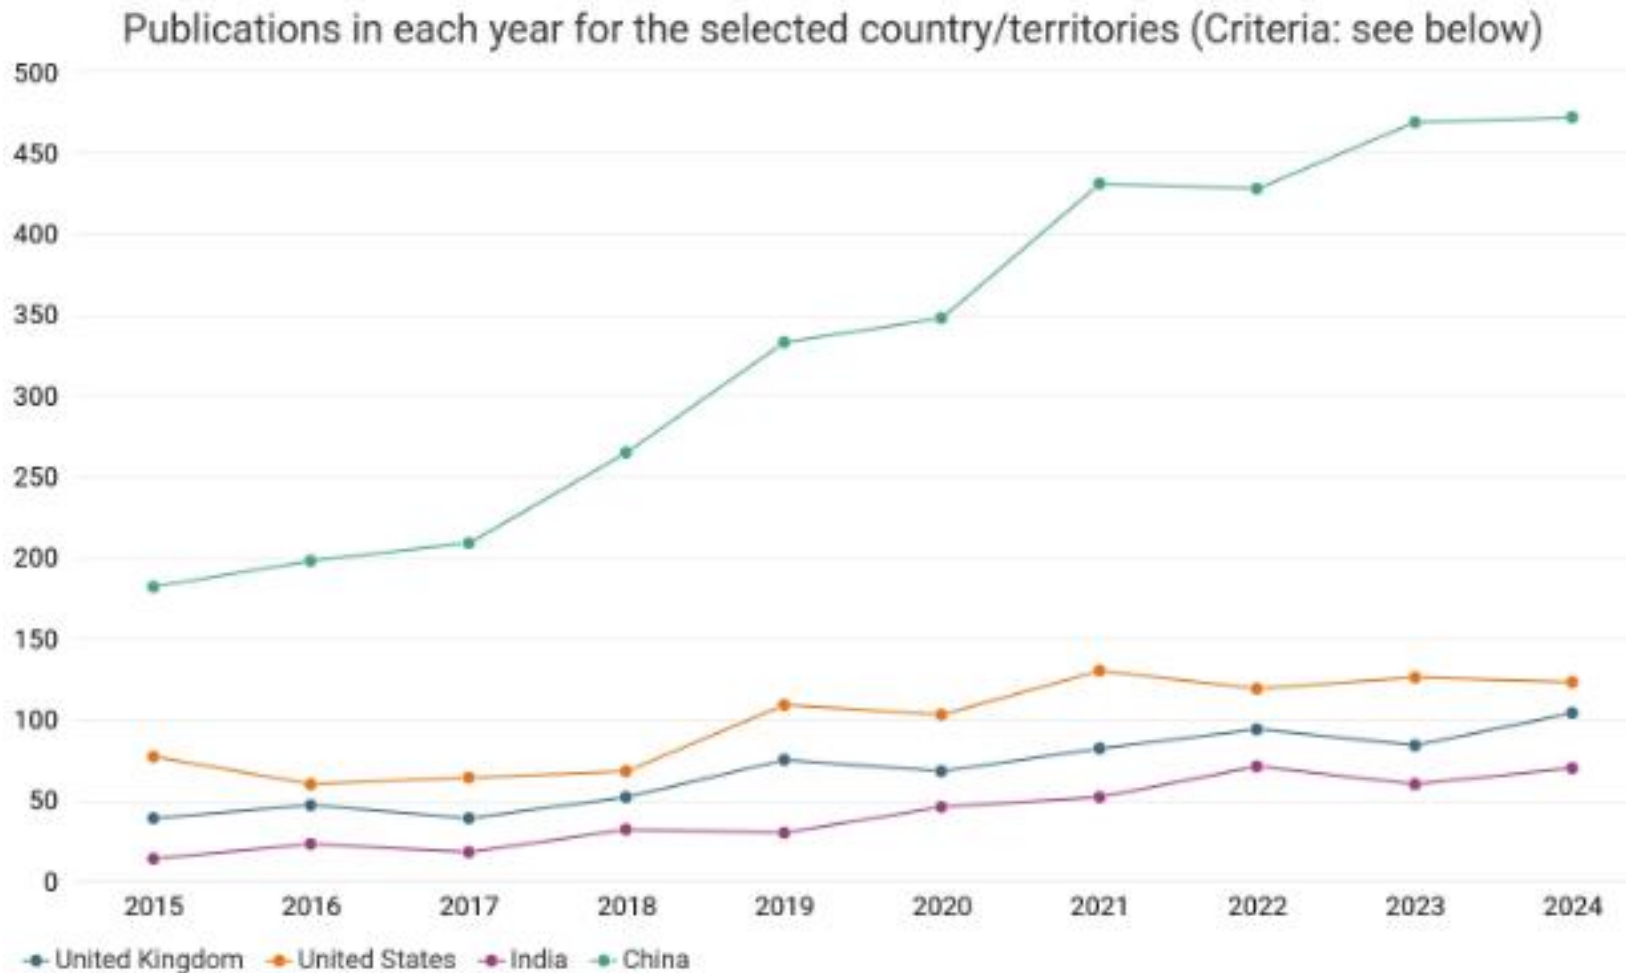

- There has been a large increase in course leavers in artificial intelligence.
- Competitive grant allocations have increased (almost doubled) from 2023 to 2024.
- There has been an increase in both domestic and international students at the undergraduate and postgraduate levels, but the increase in international students in both cases has been much greater.

The gaps

- ARC funding for AI has remained stagnant between 2010-2023, with two clear peaks in 2014 (~\$35M AUD) and 2021 (~\$30M AUD).
- There has been a decrease in permanent skilled migration of computer network professionals over the last decade.
- Only 20% of AI and computer science PhD students are female.

Actuaries
Institute.

Whole of system findings

Reliance on international collaborators (UA, China, UK)

High-Performance Computing - reaching end of life. essential for data science, statistics, modelling capabilities

Telecommunications - faster, more reliable to do science and deliver it (rural health services)

Multi-disciplinary approaches and systems thinking is essential

Science communication to demonstrate the value science to society and to build trust in science by addressing disinformation

Workforce:
Train, attract, retain. No national strategy

Accelerate science to solutions, eg medical research into clinical practice

STEM education:
Declining domestic PhDs;
Vocational training for e.g. electricians to decarbonise, plumbers for supercomputers

Modernising Research Infrastructure

Essential to conduct cutting-edge research and co-operate with scientists abroad

National agency infrastructure, eg the OPAL reactor at the Australian Nuclear Science and Technology Organisation (ANSTO), the Australian Centre for Disease Preparedness, and the Marine National Facility.

Critical gaps exist = next-generation **high-performance computing, satellite capabilities, and coordinated climate science.**

Rapid evolution of technologies (AI and Quantum) and high demand for capabilities such as high-performance computing and data.

Scale of infrastructure required to support research and innovation into the future may be beyond the abilities of an individual nation to fund and host.

Australia's approach to investment in research infrastructure must evolve to strategically grow our capabilities, rather than take a 'just-in-time' approach.

Geoscience capability highlights

Over the last decade, the number of university students completing university geoscience qualifications have fallen.

Research publications are lower than a decade ago, and have fallen as a proportion of global publications.

Permanent skilled migrants in these fields have dropped significantly in the past decade.

There are current workforce shortages of geologists and geophysicists.

Projected over the next 10 years, Australia's earths science workforce is aging.

Underpinning challenges

1. **National capability**

Australia lacks industrial diversity, making it susceptible to external shocks like trade disputes, extreme weather events, pandemics, and military conflicts.

2. **Education and science literacy**

The role of education and science literacy in ensuring the Australian public is equipped to make informed choices in a rapidly changing world.
